Bo You Want to Stop Tobacco?

YOU CAN BE CURED WHILE USING IT.

The habit of using tobacco grows on a man until grave diseased conditions are produced. Tobacco causes cancer of the mouth and stomach; dyspepsia; loss of memory; nervous affections; congestion of the retina, and wasting of the optic nerve, resulting in impairment of vision, even to the extent of blindness; dizziness, or vertigo; tobacco asthma; nightly suffocation; dull pain in region of heart, followed later by sharp pains, palpitation and weakened pulse, resulting in fatalizate disease. It also causes loss of vitality.

QUIT, BEFORE IT IS TOO LAYE.

To quit suddenly is too severe a shock to the system, as tobacco—to an inveterate user, becomes a stimulant that his system continually drayes. "Bacco-ourse" is a scientific and reliable vegetable remedy, gnaranteed to be perfectly harmless, and which has been in use tor the last 23 years, baving cared thousands of The habit of using tobacco grows on a man

fectly harmless, and which has been in use for the last 23 years, having circd thousands of habitual tobacco users—smokers, chewers and smiff-dippers.

You can use all the tobacco you want, while taking "BACCO CUBO," it will notify you when to stop. WE GIVE A WRITTEN GUARANTEE to permanently cureany case with three boxes, or refund the money will be ner cent interest.

"BACCO-CURO" is not a substitute, but a reliable and scientific cure—which absolutely destroys the graying for tobacco without the aid of will power, and with no inconvenience. It leaves the saysiem as pure and free from alcottine as the day you took your first chew or smoke.

Shoke.
Sold by all druggists, at \$1,00 per box, three boxes, (thirty days treatment, and a guaranteed cure.) \$2,50, or sent direct upon receipt of pites. HYDRO-ELECTRIC BATHS.

The Current Can Now Be Obtained from Lighting Circuits.

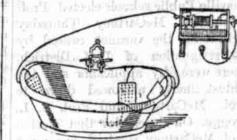

A Carative Agent Which Is Very Popular in Europe -- The Simple Apparatu Used for Single Baths in Residences.

Electricity taken from lighting circuits is now employed in Europe as a curative agent. The current is controlled by suitable instruments, so that the tension is below the point where harm could be inflicted to delicate persons. Electricity in medicine has probably not made as great an advance as its importance merits, but this may be largely attributable to the state of empiricism of electro-therapeutics or to the great difficulties in the way of the employment of the electrical apparatus themselves.

The idea of employing water in a bath for conveying the current to a patient is almost as old as the therapeutic application of dynamic electricity, the electricity being used in two forms-the continuous current and the faradic bath. The former is largely employed in Germany, while recently interesting researches upon the faradic current have been made by French, English and Italian physicians. These experimentalists followed up the pecultar effects shown by Dr. d'Arsonval to be produced on the human body by alternating currents of a definite form-the sinusoidal form in which for a given maximum inensity the instantaneous variations ere slightest.

In France the employment of this orm of current has been very successful, the method followed considerably implifying the apparatus required for the installation. The currents used are extremely weak. In order to lower the tension of the current of the lighting circuit and graduate its strength, a ransformer is employed, which lowers he tension to fifteen volts. This is he maximum required, and in a large nstallation each bath is arranged with transformer with a sliding armature, enabling the tension to be varied gradually from fifteen volts to one or two

Where only a single bath is to be fited up, as in a private residence, there is employed a combination in series of shocking coil and a small transformer. The whole is placed in a little marble receptacle above the bath and at one side, as shown in the accompanying ilustration, reproduced from the Revue

ELECTRIC THERAPEUTICS FROM LIGHTING CIRCUITS.

Internationale de l'Electricite. The secondary of the transformer moves along slides, and a rod passing to the outside enables the current to be regulated from a maximum to a minimum strength. The primary circuit is provided with an interrupter. The wires of the secondary proceed directly to the electrodes, which are simple plates of metal that can be placed anywhere in the bath by means of suspending hooks. There may also be added an amperemeter for continuous and alternating currents, by means of which the strength of the currents can be esimated with strict accuracy.

The conditions under which the elecricity is employed have been fully determined by experiment. The first measurement of interest is that of the resistance of the bath when filled with ordinary water, and also the intensity of the current and the difference of potential at the electrodes. The determination of the resistance of the body when immersed in the bath is found by first testing the quantity of current required when the subject is in the bath, next finding the resistance of the same quantity of water without the subject, and then adding the requisite amount of water necessary to bring the bath to the exact level when the subject was immersed and determining the current required to overcome the resistance.

The conclusions reached by these experiments were that, with water of comparatively good conductivity, the human body when submerged offers a resistance somewhat above that of an equal volume of water, and that the current passing through the middle section of the body is equal to about one-tenth of the total current passing into the bath.

The employment of electricity by the utilization of the industrial currents, which are within the reach of all physicians, connected as they are with the lighting system of towns, would seem to open up a wider field of application for this method of medical treatment.

Enit on the Contribution Plate.

A well-known bishop tells a story of a vestryman at a village church who deliberately took half a crown out of the plate as he brought it up to the communion table and slipped it into his pocket. "I saw him take it," said the bishop, "and intended to charge him with it at the end of the service, but carried away by the sublimity of the service I forgot all about it. Next day I remembered and spoke about it." "Oh, sir," said the old man, "never you worry about that; that half dollar has done good service for many years. I keep it to put down first, and then the gentry, seeing a poor man like me put a half dollar in the plate, can't for shame give less."

High Prices Paid for Furs. Very high prices have been paid for furs this year in London. A sea otter skin, stripped off glove fashion, with-out being cut down the stomach, brought \$1,125, the highest price on record for a single skin, and one black fox skin sold for \$850. They went to

WILL HE BE SEAYED? Mr. Dupont's Peculiar Election to the

United States Senate. Just before adjourning the republican members of the Delaware legislature elected Col. Henry A. Dupont to the United States senate. The governor of the state, however, pronounces the election irregular, and an appeal will have to be taken to the senate.

Col. Henry A. Dupont, who may succeed Senator Higgins, was born July 30, 1838, in New Castle county, Del. and besides being a millionaire railroad president, is a member of one of the historic families of that state. He is a son of Gen. Henry Dupont, who is credited with having held the Delaware troops in line for the union at the breaking out of the rebellion, and is a

great-grandson of Eleuthere Irence Dupont de Nemburs, the founder of the great Dupont powder works near Wilmington. Col. Dupont was appointed to a cadetship at West Point, and graduated from the military academy in May, 1861. He immediately entered the army of the north, choosing the artillery branch of the service. He served with bravery and distinction, coming out of the war with the rank of colonel. The late President Hayes in some of his writings paid the young artillery officer a high and deserved compliment for the courage and dash with which he made an advance on the enemy while in an engagement under the Ohio general.

After the war Col. Dupont was associated with the various business enterprises of the family until 1878, when he entered the railroad service, in which he has continued to the present time. He is the partner in the firm of E. I. Dupont de Nemours & Co., generally known as the Dupont Powder company, but takes little part in its active management, that duty falling to his cousin, Eugene Dupont, who is a practical powder-maker. Since 1978 Col. Dupont's time and attention have been chiefly absorbed by his railroad service. He began his career in that line as director of the Wilmington & Northern rail-

REAR ADMIRAL ALMY.

He Had More Active Sea Service Than Any Other Naval Officer.

The family and friends of Rear Admuch alarmed about his illness. Owing to his advanced age few hopes are entertained that he will survive the present attack, as he is very ill.

A native of Rhode Island, where he was born April 25, 1815, John J. Almy was early inured to a life on the water. He was but 14 when he became a midshipman and cruised in the Mediterranean and on the coast of Brazil. At twenty he was a past midshipman, and occupied several minor positions in the service during the next few years. He gained his commission as lieutenant in 1841, and was attached to the Ohio in the Gulf of Mexico and the Pacific during the Mexican war. In the troublous times off the coast of Nicaragua in the 50s Lieut. Almy had an important work to do. He commanded the Fulton, and in that position did his duty so eredibly as to call for high commendation from the admiral commanding, Rear Admiral Paulding. That officer characterized Lieut. Almy's performances thus: "He performed his part of the work exceedingly well, and is an officer to be relied upon at all times." He commanded the Fulton in the Paraguay expedition, and on the outbreak of the civil war was made commander and did valuable service

REAR ADMIRAL JOHN J. ALMY.

during the blockade. In 1865 he was commissioned as captain, and in Deof commodore conferred upon him.
Four years later he was appointed to the rank of rear admiral, and was appointed to command the United States naval forces in the Pacific. In the revolution in Panama he, by his action at a critical moment, saved the City of Panama and the Panama railroad from cember, 1869, he had the added dignity being destroyed, and afforded needed protection to both American and European residents, though he had only a comparatively small force at his immediate command. He received the thanks of the whole of the people whose interests he had so ably protected. From the king of Hawaii he hameha I., in appreciation of courtesy and attentions bestowed upon his majesty during his journey through the United States. In 1877 he retired under the operation of law, having performed twenty-seven years and teamount up to the present time of any officer in the service. received the Order of King Kame- Don't Tobacco S,it or Smoke Your
